Purification of lactoferrin from low-fat bovine milk by cation-exchange chromatography

Kajsa Eriksson, Carina Engstrand and Lars Haneskog; Bio-Works Technologies, Uppsala, Sweden

Introduction
Lactoferrin is a globular glycoprotein found in secretory fluids of mammals. It controls the concentration of free iron, and is part of the innate immune system. Several mechanisms have been found for antibacterial and antiviral actions of lactoferrin. The protein binds specifically to various components to the cell surface of microorganisms. When lactoferrin binds the free iron it depletes the microorganisms from essential substances. Lactoferrin also binds to lipoproteins of cell membranes to compete with the entrance of virus particles into the cell. There are studies showing promising anticarcinogenic properties of lactoferrin.

The bioactive properties has created a large growing demand for lactoferrin produced from bovine milk for use in infant formula, dairy products, dietary supplements, for skin and oral care, and other products. The global market for lactoferrin is more than 200 tons per year.

The bovine milk lactoferrin has a molecular weight of ca 78 kDa and a pI of 7.9. Purification can be done by cation-exchange chromatography directly from milk depleted of fat (<0.1%).

We have investigated the capture of lactoferrin on WorkBeads™ 40 S chromatography medium from pasteurized standard bovine milk with 0.1% fat.

Results
Pure bovine milk-lactoferrin was used to investigate elution conditions and dynamic binding capacity (Q_{B,10%}) on WorkBeads 40 S. A concentration of ca 1 M NaCl was required for elution (Fig. 1). The binding capacity was ca 78 mg/ml at 3 minutes residence time (Fig. 2). Lactoferrin was purified from bovine milk (Fig. 3) and from whey (see SDS-PAGE pt 3). The separation yielded excellent purity in a single step, and show promises for scale-up.

Figure 1 Determination of elution conditions on BabyBio™ S 5 ml column.

Column: BabyBio S 5 ml
Medium: WorkBeads 40 S
Flow: 2.5 ml/min
Sample: 50 ml 1 mg/mL Lactoferrin in 50 mM Na-Pi buffer, pH 6.8
Binding buffer: 50 mM Na-Pi buffer, pH 6.8
Elution buffer: 50 mM Na-Pi buffer, 1.2 M NaCl, pH 6.8
Elution: Gradient 0-100% Elution buffer

Figure 2 Dynamic binding capacity determination. (A) Example of frontal analysis of pure lactoferrin on WorkBeads 40 S. (B) Binding capacity vs. residence time.

Column: BabyBio S 5 ml
Medium: WorkBeads 40 S
Flow: 2.5 ml/min
Sample: 500 ml low-fat milk (pH 6.6)
Binding buffer: 50 mM Na-Pi buffer, pH 6.8
Elution buffer: 50 mM Na-Pi buffer, 1.2 M NaCl, pH 6.8
Elution: Step gradient 50% and 100 % Elution buffer
Cleaning-in-place: 1 M NaOH
